

The Pittsburgh template

A beamer theme based on metropolis

Outline of demo presentation

1. **An overview of the pittsburgh template**
2. Some cool features

What is the pittsburgh template?

pittsburgh is a beamer template based on the widely used metropolis theme.

It's called "pittsburgh" because Pittsburgh, PA is a metropolis.

Why?

I *love* the aesthetics of Apple's Keynote presentations on macOS but

1. Keynote only runs on macOS and thus presentations are lost when switching OSs,
2. Its files tend to be quite large relative to their content, and
3. Its math fonts don't match the $\text{\LaTeX}$ ones.

Beamer fixes the above and `pittsburgh` attempts to carry over the slick design of Keynote.

Outline of demo presentation

1. An overview of the pittsburgh template
- 2. Some cool features**

Cool feature I: *Pretty text boxes*

Contextual bandits (Langford & Zhang, '07)

For $t = 1, 2, \dots$:

Agent observes a context X_t (typically in $\mathbb{R}^d$).

Agent takes action $A_t \sim h_t(\cdot \mid X_t)$.

Agent observes reward R_t (typically in $\mathbb{R}$).

EndFor

Cool feature II: *Adjustable width*

What if a particular sentence just barely fits in one line?

Like that one above. The widen command allows you to dynamically widen or shrink the allowable width:

“What if a particular sentence just barely fits in one line?”
